Homogenization for Grid Structures Given the difficulties associated with the model for the grid described in the previous section, it is of interest to approximate grid-like and truss-like structures with a model that retains physical fidelity but is computationally more tractable than a direct physical model. One such approximate model can be formulated using homogenization techniques which were originally developed to model composite material structures. Here we outline results for a grid structure similar to that of Section 3. Details for this grid and other lattice truss derivations can be found in BCR , R , BLP , CS , CD , and SP . The basic idea in our use of homogenization is to approximate a model such as (3. 1)-(3. 5) or, equivalently, (3. 7), by a homogenized model (HE) on a domain in which the holes or perforations have been filled in . That is, instead of a perforated domain p, r as described in Section 3, we wish to compute on the domain $fl (0, a) (0, b)$. The model associated with this domain, even if it is plate-like in form, will, of course, be nonphysical. The coefficients in the distributed system will be nonphysical parameters. The homogenization procedures we outline here require periodicity in the structure (many regularly placed holes) as well as sparseness of material in the structure. Thus we consider a grid structure...
